The newest version of the UMIT project is UMIT version 0.0.0.3. It's a cross platform, easy to use, fast and highly customizable nmap frontend and it's been developed in GTK and Python. The project goal is to develop a nmap frontend that is really useful for advanced users and easy to be used by newbies. With UMIT, a network admin could create scan profiles for faster and easier network scanning or even compare scan results to easily see any changes. A regular user will also be able to construct powerful scans with UMIT command creator wizards. Why Python? Python is an object oriented script language with great portability and performance. It can run in almost every platform available (Including Windows, Mac OS X, *NIX, Symbian, Palm OS and others). So, using Python, UMIT is developed in a single code base, and runs unmodified on multiple platforms. Why GTK? GTK is a graphical user interface development toolkit written in C and it's licensed under LGPL. Currently, GTK has lots of widgets and is very customizable. ... Hey guys this is my first tutorial about Python. It's already simple, but have a nice overview of the basics. This tutorial assumes you have Python already installed on your pc. If not check this tutorial first: Anyway, in this tutorial you are going to do the following. -Read and understand a simple code, In this case the Python source code of the book "Hello world" -Execute the code After you are done with this tutorial, the best way to learn python is to get a book and start reading it and playing around with the code. But, if you want you can get to the end of this tutorial without reading a book, but for this you need to get an API first, in this tutorial I will use the Github API, you can get more information about it on the github site: To make a Git request, python gives you all the methods you need. I will send a GET request to the api using 2 methods: 1) The first one is the request, you will use is with urllib2, you can read more about it here:
