\$30 million paid after a breach, the price of all stolen assets would be about \$1.5 billion, and the price of all stolen credit card data would be about \$100 billion. In 2009, after talking with some of his tech friends, Mueller faced the inevitable conclusion that even a \$5-million bounty for individual reputational information would cost at least \$300 million, and that the price for paid-off hackers was much higher. It was clear that simply relying on expensive and unreliable security was not a good business plan, so he and his partners established the firm InfraGard, which promises to serve as a kind of tech-industry version of the FBI's Neighborhood Watch groups that give tips about suspicious activity in their communities. (It holds its first meeting next month.) Mueller is evidently enthusiastic about InfraGard's prospects: "We will see if we can take a step in the area of intelligence sharing and analytical so that we can better understand and counter threats like these," he says. "It's a very appealing idea, and I really like the idea of trying to create some type of umbrella, or a community of business leaders who, left to their own devices, could really help us figure things out." If that seems ambitious, remember that InfraGard's founding group of about 50 members just happens to have significant influence and clout. They include such industry heavyweights as Facebook, PayPal, and eBay, as well as Warner Bros., IBM, Microsoft, and Xerox. And last year the Homeland Security Advisory Council reported that only about 30 percent of companies are effectively sharing intelligence with the government, although a careful study found that 95 percent are "willing and able." Mueller calls it the "fifth column" of society, a reference to the people who can turn domestic allies into traitors. But he says that InfraGard is not a political group. "We're not trying to make a statement in the way that Anonymous has taken on the CIA, or DDoS has taken on the banking industry," he says. "There's no sense in us doing that. It's not our purpose." What InfraGard actually does is to bring together the network of people who care about cybersecurity, and who, thanks to our new culture of social media, can tell us
